Debugging a failing pod

Start by checking what the scheduler and kubelet say about the pod.

```
kubectl get pods -n kube-system -o wide
kubectl describe pod web-7d9 -n demo
kubectl logs web-7d9 -n demo --previous \
  --tail=50
```

If the pod is CrashLoopBackOff, read the previous container’s logs first.

```
kubectl rollout restart deployment/web -n demo
```
